**ANNEX IV****LIST OF BIODIVERSITY INDICATORS FOR AGRICULTURAL ECOSYSTEMS REFERRED TO IN ARTICLE 9(2)**

Indicator	Description, units, and methodology for determining and monitoring the indicator
Grassland butterfly index	<p><b>Description:</b> This indicator is composed of species considered to be characteristic of European grasslands and which occur in a large part of Europe, covered by the majority of the Butterfly Monitoring Schemes. It is based on the geometric mean of species trends.</p> <p><b>Unit:</b> Index.</p> <p><b>Methodology:</b> as developed and used by <i>Butterfly Conservation Europe, Van Swaay, C.A.M, Assessing Butterflies in Europe - Butterfly Indicators 1990-2018</i>, Technical report, <i>Butterfly Conservation Europe</i>, 2020.</p>
Stock of organic carbon in cropland mineral soils	<p><b>Description:</b> This indicator describes the stock of organic carbon in cropland mineral soils at a depth of 0 to 30 cm.</p> <p><b>Unit:</b> tonnes of organic carbon/ha.</p> <p><b>Methodology:</b> as set out in Annex V of Regulation 2018/1999 in accordance to the 2006 IPCC Guidelines for National Greenhouse Gas Inventories, and as supported by the Land Use and Coverage Area frame Survey (LUCAS) Soil, Jones A. et al., <i>LUCAS Soil 2022</i>, JRC technical report, Publications Office of the European Union, 2021.</p>
Share of agricultural land with high-diversity landscape features	<p><b>Description:</b> High-diversity landscape features are elements of permanent natural or semi-natural vegetation present in an agricultural context which provide ecosystem services and support for biodiversity. In order to do so, landscape features need to be subject to as little external disturbances as possible to provide safe habitats for various taxa, and therefore need to comply with the following conditions:</p> <ul style="list-style-type: none"> <li>a) they cannot be under productive agricultural use (including grazing or fodder production), and</li> <li>b) they should not receive fertilizer or pesticide treatment.</li> </ul> <p>Land lying fallow can be considered as high diversity landscape features if it complies with criteria (a) and (b) above. Productive trees part of arable land agroforestry systems and productive elements in non-productive hedges can also be considered as high diversity landscape features, if they comply with criterion (b) above, and if harvests take place only at moments where it would not compromise high biodiversity levels.</p> <p><b>Unit:</b> Percent (share of Utilised Agricultural Area).</p> <p><b>Methodology:</b> as developed under indicator I.21, Annex I of Regulation 2021/2115, as based on LUCAS for landscape elements, Balin M. et al., <i>Redesign sample for Land Use/Cover Area frame Survey (LUCAS)</i>, Eurostat 2018, and for land laying fallow, <i>Farm Structure</i>,</p>

### **COMMON FARMLAND BIRD INDEX AT NATIONAL LEVEL**

#### **Description**

The Farmland Bird Index (FBI) summarises population trends of common and widespread birds of farmland and is intended as a proxy to assess the biodiversity status of agricultural ecosystems in Europe. The national FBI is a composite, multispecies index that measures the rate of change in the relative abundance of farmland bird species across selected survey sites at national level. The index is based on specially selected species that are dependent on farmland habitats for feeding and or nesting. National common farmland bird indices are based on species sets that are relevant to each Member State. The index is calculated with reference to a base year when the index value is typically set at 100. Trend values express the overall population change in the population size of the constituent farmland birds over a period of years.

**Methodology:** Brník et al. (2021): Long-term and large-scale multispecies dataset tracking population changes of common European breeding birds. Sci Data 8, 21. <https://doi.org/10.1038/s41597-021-00804-2>

“Member States with historically more depleted populations of farmland birds” means Member States where half or more species contributing to the national common farmland bird index have a negative long-term population trend. In Member States, where information on long-term population trends is not available for some species, information on the European status of species is used.

These Member States are:

Czechia  
Denmark  
Estonia  
Finland  
France  
Germany  
Hungary  
Italy  
Luxembourg  
Netherlands  
Spain

“Member States with historically less depleted populations of farmland birds” means Member States where less than half of species contributing to the national common farmland bird

index have a negative long-term population trend. In Member States, where information on long-term population trends is not available for some species, information on the European status of species is used.

These Member States are:

Austria

Belgium

Bulgaria

Croatia

Cyprus

Greece

Ireland

Latvia

Lithuania

Malta

It is defined in the range of 0 to 100.</p> <p><b>Unit:</b> Index.</p> <p><b>Methodology:</b> as developed by FAO, Vogt P., et al., <i>FAO – State of the World's Forests: Forest Fragmentation</i>, JRC Technical Report, Publications Office of the European Union, Luxembourg, 2019.</p>

<p>Common forest birds index</p> <p><b>Description:</b> The forest bird indicator describes trends in the abundance of common forest birds across their European ranges over time. It is a composite index created from observational data of bird species characteristic for forest habitats in Europe. The index is based on a specific list of species in each Member State.</p> <p><b>Unit:</b> Index.</p> <p><b>Methodology:</b> Brilink et al. <i>Long-term and large-scale multispecies dataset tracking population changes of common European breeding birds</i>, Sci Data 8, 21. 2021.</p>	<p><b>Description:</b> This indicator describes the stock of organic carbon in the litter and in the mineral soil at a depth of 0 to 30 cm in forest ecosystems.</p> <p><b>Unit:</b> tonnes organic carbon/ha.</p> <p><b>Methodology:</b> as set out in Annex V of Regulation 2018/1999 in accordance to the 2006 IPCC Guidelines for National Greenhouse Gas Inventories, and as supported by the Land Use and Coverage Area frame Survey (LUCAS) Soil, Jones A. et al., <i>LUCAS Soil 2022</i>, JRC technical report, Publications Office of the European Union, 2021.</p>

## **ANNEX VII**

### **LIST OF EXAMPLES OF RESTORATION MEASURES REFERRED TO IN ARTICLE 11(8)**

- (1) Restore wetlands, by rewetting drained peatlands, removing peatland drainage structures or de-poldering and discontinuing peat excavation.
- (2) Improve hydrological conditions by increasing quantity, quality and dynamics of surface waters and groundwater levels for natural and semi-natural ecosystems.
- (3) Remove unwanted scrub encroachment or non-native plantations on grasslands, wetlands, forests and sparsely vegetated land.
- (4) Apply paludiculture.
- (5) Re-establish the meandering of rivers and reconnect artificially cut meanders or oxbow lakes.
- (6) Remove longitudinal and lateral barriers (such as dikes and dams), give more space to river dynamics and restore free-flowing river stretches.
- (7) Re-naturalise river beds and lakes and lowland watercourses by e.g. removing artificial bed fixation, optimising substrate composition, improving or developing habitat cover.
- (8) Restore natural sedimentation processes.
- (9) Establish riparian buffers, e.g. riparian forests, buffer strips, meadows or pastures.
- (10) Increase ecological features in forests, such as large, old and dying trees (habitat trees) and amounts of lying and standing deadwood.
- (11) Work towards a diversified forest structure in terms of vegetation and age, enable natural regeneration and succession of tree species.
- (12) Enhance forest diversity by creating mosaics of non-forest habitats such as open patches of grassland or heathland, ponds or rocky areas.
- (13) Make use of “close-to-nature” or “continuous cover” forestry approaches; introduce native tree species.
- (14) Enhance the development of old-growth native forests and mature stands (e.g. by abandonment of harvesting).
- (15) Introduce high-diversity landscape features in arable land and intensively used grassland, such as buffer strips, field margins with native flowers, hedgerows, trees, small forests, terrace walls, ponds, habitat corridors and stepping stones, etc.
- (16) Increase the agricultural area subject to agro-ecological management approaches such as organic agriculture or agro-forestry, multicropping and crop rotation, integrated pest and nutrient management.
- (17) Reduce grazing intensity or mowing regimes on grasslands where relevant and re-establish extensive grazing with domestic livestock and extensive mowing regimes where they were abandoned.
- (18) Stop or reduce the use of chemical pesticides as well as chemical and animal manure fertilizers.

- (19) Stop ploughing grassland and introducing seeds of productive grasses.
- (20) Remove plantations on former dynamic inland dune systems to re-enable natural wind dynamics in favour of open habitats.
- (21) Improve connectivity across habitats to enable the development of populations of species, and to allow for sufficient individual or genetic exchange as well as for species' migration and adaptation to climate change.
- (22) Allow ecosystems to develop their own natural dynamics for example by abandoning harvesting and promoting naturalness, wilderness.
- (23) Remove and control invasive alien species, and prevent or minimize new introductions.
- (24) Minimise negative impacts of fishing activities on the marine ecosystem, for example by using gear with less impact on seabed.
- (25) Restore important fish spawning and nursery areas.
- (26) Provide structures or substrates to encourage the return of marine life, for example coral/oyster/boulder reefs.
- (27) Restore seagrass meadows and kelp forests by actively stabilising the sea bottom, reducing and, where possible, eliminating pressures or by active propagation and planting.
- (28) Reduce various forms of marine pollution, such as nutrient loading, noise pollution and plastic waste.
- (29) Increase urban green spaces with ecological features, such as parks, trees and woodland patches with native species, green roofs, wildflower grasslands, gardens, city horticulture, tree-lined streets, urban meadows and hedges, ponds and watercourses.
- (30) Stop, reduce or remediate pollution from pharmaceuticals, hazardous chemicals, urban and industrial wastewater, and other waste including litter and plastics as well as light in all ecosystems.
- (31) Convert brownfield sites, former industrial areas and quarries into natural sites.
